

Recycling and Reduction

This show all the different recycling bins for recycling.

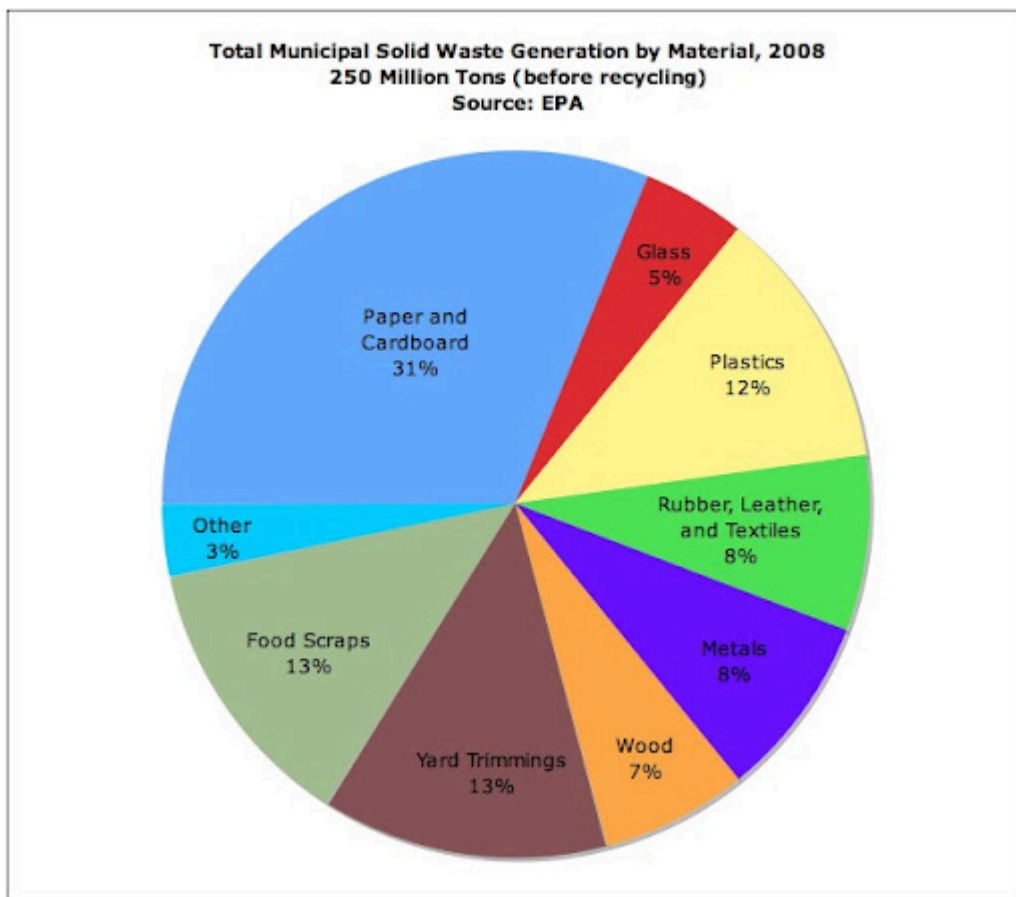

The picture below shows what garbage sites look like.

This picture shows what happens when you do not recycle things that can be recycled. It hurts the environment and hurts the earth that you live in. It hurts animals and trees that help you breathe. As a website called All country Recycling states“ When landfills are filled with non-recyclable materials, they can release toxic fumes into the air which can have a major impact on local wildlife habitats. In addition, when landfills run out of space they often require additional acreage, which means more natural areas will be destroyed to make room for them. This destruction leads to a decrease in biodiversity as habitats are wiped away without any regard for the species they contain “ Habitats are the natural places for animals to live in without them the animals will eventually become extinct. Animals aren’t familiar with garbage and we should keep it

this way because they might see it as food and try to eat it. I know this because it states in a website “Wildlife are not accustomed to garbage in their environments. This means that when they do come across a piece of trash, they may mistake it for food or try to play with it, like this sea otter. This can lead to the animal becoming entangled in the garbage or ingesting it, both of which can be fatal.”

Here is a data table of how bad it has gotten.

This is why I think we should recycle to reduce the amount of garbage because this is our planet and our responsibility.
