

A way People can reduce, reuse, and recycle is by using cardboard to make things like phone cases, jars, modes of architecture, and many other things. For example on cardboardbalers.org it states "An average household can throw away as much as 13,000 pieces of cardboard every year." Another example is that on bobvila.com it states "90 percent of all products in the United States are still sent using some type of cardboard packaging." A final example is that on gardeningknowhow.com it states "Cardboard waste makes up 31 percent of landfills." This shows that a way people can reduce, reuse, and recycle is by making things with cardboard because we have so much extra cardboard to use.
