

Name: Bailey Prashaw

---

An idea to help people recycle is to make real life holograms for trash bins that will yell at people! An example of what the hologram may say is, "if you have plastic, don't put it in the trash" or "we will find you!" Just to scare people into putting plastic items into the correct recycling bins. I mean, it may make people weirded out or confused, but it probably will most definitely increase the recycling rate resulting in better recycling practices in our community.

Holograms are new technology and may be expensive but worth it. The hologram doesn't just need to be used for plastic you can make one for cans and bottles too. Some people might still put the wrong items in the trash on purpose just to see if someone will actually "come find them", or just to prove that they are actually not scared of the hologram.

People in our area may listen to the hologram and think how they need to recycle more and actually do it. Humans who actually believe the hologram (which is highly likely) will be doing their part to help save the planet.

There are many ways people would react to this Hologram, good, bad and ugly. However I believe with technology and a little humor people will respond in a way that is helpful to saving the planet.
