

Save OUR Earth!

Student Name: Anaya Layla
School Name: PS 144 Col. Jeromus Remsen School

Introduction

We can reduce, reuse and recycle! These three things can help our world to be a safer place to live. It creates more natural organic items instead of artificial. But some people do not do this. This is one of the many things that are causing the planet to get polluted. You might think that this is not a big deal when it is. Pollution is one of the biggest problems in the world. If more people reduce, reuse and recycled, pollution will not have even been a big deal.

Reduce

What is reduce?

Reducing means to use those things less which harms our environment. We can reduce in many ways-

1. Instead of keeping the faucet on the whole time we brush our teeth, we can only turn it on when we need it. That is how we can reduce use of water.
2. One way of reducing usage of ground water, is using rainwater. We can collect and save rainwater and use it for gardening.
3. We can use more public transportation such as buses, trains. We can also ride bicycle, electric cars and walk for the short distances. This will help us to reduce using gas, save energy and stop air pollution.

Reuse

What is reuse? Reusing means using somethings repeatedly to save our environment. We can reuse in many ways-

1. One of the ways to reuse is with compost. Compost is made from many fruits and vegetable peelings. Like banana and orange peelings and apples cores too, and so much more. We can mix these in plant soil so the plant can grow better because of the natural fertilizer and not chemical fertilizer (that is made in factories). So instead of throwing out peelings you can use it to help your plants and make the earth greener.
2. Instead of using a plastic bag, cloth bags can be reused repeatedly, and not throw it out every time.
3. We can reuse glass bottles-cups, instead of one-time plastics.

Recycle

What is recycling? Recycling is all about reusing things, like paper, plastic, metal and more. Recycling takes your trash to another level and makes something new. Doing this can really help your environment.

We can recycle by using things and making them into new ones. Like after you throw out something plastic, factories will break it down and make it something glass. This shows you are reusing something more than once.

Conclusion

These 3 things will change our world for the better, well if an accurate number of people do it. Even though I gave only one example of each there are still many ways to reduce, reuse and recycle. So when even you reduce, reuse or recycle you should know you are making a change and helping then world.
