

Why is recycling important? by : Kendra Law

Recycling is something that everyone should do to make the world cleaner and a better place. There are many reasons that we should recycle. Lots of plastic and waste can hurt our ecosystem and our beautiful blue planet. In this essay, I will share the reasons why recycling is important.

Our beautiful planet Earth is very special. Earth is where us humans and many other creatures live. But because of plastic and waste , many animals are dying and populations of many animals are decreasing. More than 100 million animals die from plastic waste alone. For example, animals like turtles are dying from plastic bottles and straws. They are not able to digest the plastic. When they die, the plastic goes back in the ocean. Which means more animals could eat the plastic. We need to stop harming the animals with plastic.

These animals need our help. We can help simply by recycling. Recycling is when we take used plastic and make it into something new. For example, if we were to recycle a plastic bottle, it would eventually turn into something else, or even another bottle. This helps in many ways. This reduces the amount of plastic we use. Which means we don't have to make more plastic. This may save many lives of animals. Even recycling one singular plastic bottle may have saved an animal from eating the bottle.

In conclusion , recycling is very important. If everyone recycles, our planet would be much cleaner. With your help, we can save the lives of many animals. We can work together to decrease the amount of plastic that harms the animals of our Earth. Recycling can really help our planet.
