

TRASH IS SO MUCH MORE THAN GARBAGE!

Trash is made by so many processes, and it contaminates the environment. For example factory's, the smoke the factory gives off can be very dangerous to the oxygen around us. Also, this "trash" is only used once by people and then its transported to landfill and these landfill can take Thousands of years to decompose, and they can give off chemicals to the soil and destroy plant life around it.

What people can do to reduce the amount of garbage thrown to the landfill if to use the trash in a useful way or just place the trash in the recycle bin so they can be crushed or melted to make more of its products or just new items, ways that we can use these pieces of trash is to use them for art like a bunch of ice cream sticks to make a stickman or a house out of sticks and more. Or use an empty piece of can and then color it and use it as a pencil holder
