This has a camera that can detect bad air.

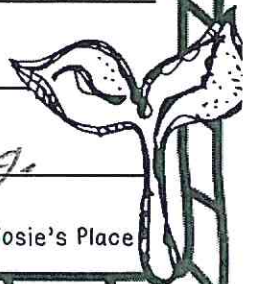

Opens when drone detects bad air to suck it in. Then lets out healthy air.

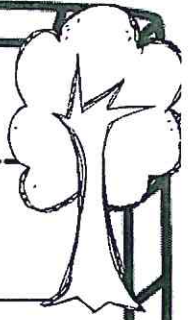

Global Warming

Global warming has been a big problem for many years. Things like carbon dioxide and pollution are things that are damaging the environment that we live in. Carbon dioxide is essential to the survival of plants and animals, but too much of it can cause all life on Earth to die. Carbon dioxide can also have other effects. Too much of it will raise the temperature and melt the snow caps hence Global warming.

Name Noah Riley

Pollution is also affecting our ecosystem, with people littering and factories and cars producing gases that pollute the air. I think we could invent air cleaning machines that can take in bad air and produce clean air like trees. This is my idea to help the environment.
