

We all use lots of energy, but is it use, or waste it. don't agree, well then insist to this. have dunken out of a can before? And then throw it away, well if you have, you threw away the result of So much energy some of that energy nonrenewable, some of that nonrenewable energy is from coal and pollutes the air. So here is a question how does recycling save energy if a ple. relese a new phone, but you had the last phone that relese don't just throw th old one away! keep it. so you know how much coal garbage trucks use. Answer: A lot! how can you save energy? maybe unplug your computer when not in use, not charging fully charged things, turning off all your lights in your home if you are not in it. Recycling! reducing! you don't think we need to save energy!

Nonrenewable energy: energy that we will run out of
 renewable energy: energy the we can get more of if we run out

ok, well here's why. most of the energy we use is nonrenewable, so you should save it if you still gona use it now. how go save energy.
