

Reducing, reusing and recycling are good for the environment. Reducing is to stop making more trash. Reusing is to find new ways to use trash instead of throwing it out. Recycling is to make new things out of trash.

Reducing is when you shorten the amount of trash that you are throwing away. Garbage is harmful to the environment so it is important to reduce. For example, people can reduce by using reusable water bottles instead of using plastic water bottles because you have to throw out normal water bottles when you are done drinking them. If people use reusable water bottles, they can refill it when they are done drinking from it, and don't have to throw them out. People can also reduce by using reusable shopping bags instead of using normal bags so they don't have to throw it out and can reuse the bag when they go shopping. Another way people can reduce is by donating things that they want to throw away. In conclusion, reducing can help the environment by keeping it cleaner, stopping pollution, and saving money.

Reusing is to find new ways to use trash instead of throwing it out. Reusing can help the environment by reducing pollution. One way that people can reuse is by using the same paper bag for shopping, storage, packing, compost, and crafts. Reusing can help people save money and energy. Things that people can reuse are containers, bags, clothes, jugs, newspapers, and cans. You can reuse containers by using them to store things. People can reuse jugs by refilling them. One way to reuse newspapers is to use them for wrapping things instead of throwing them out when you finish reading them. In conclusion, reusing helps the environment by reducing waste and pollution.

Recycling is to turn trash into products. Recycling can help the environment by reducing pollution, generating less solid waste, and saving energy. Recycling can also reduce the amount of waste sent to landfills. People can recycle milk cartons, clothes, cardboard boxes, plastic bottles, and plastic bags. People can recycle cardboard boxes by throwing them inside of the recycling bin. After the cardboard box is in the recycling bin, sanitation workers can pick it up and send it to a factory where the cardboard box can be recycled. The cardboard box can be turned into paper. Recycling can also prevent pollution. In conclusion, recycling can help the environment.

As you can see, reducing, reusing, and recycling is good for the environment.
