Britany Malla
6th Grade Mrs. Daily
Ella Fitzgerald Academy, Yonkers NY

My family and I always have loved to play in the snow. Playing in the snow is one of the most fun things to do in winter. But because of greenhouse effects, future generations might not be able to. Can you imagine having no winter? It would be awful! To stop this from happening, we must reduce the greenhouse effect before it is too late.

Most scientists would say that taking away the greenhouse effect would be a sad thing. The greenhouse effect is" the way in which heat is trapped close to Earth's surface by greenhouse gases" (NASA). After reading this, you may be wondering why I want to reduce greenhouse gases. However, if greenhouse gases keep on multiplying, this causes the temperature to rise. This may sound good but according to Britannica, "About three-fourths of human-caused greenhouse gases come from the burning of fossil fuels, such as coal, oil, and natural gas. When fossil fuels are burned, carbon dioxide is emitted." Most humans use these resources for many uses, which is bad since this can increase the temperature in the atmosphere.

We must reduce greenhouse gas emissions since they cause the earth to become warmer, which is one of the major reasons for global warming. An example is "Human activities are responsible for almost all of the increase in greenhouse gases in the atmosphere over the last 150 years" (EPA). Can you believe that we are the cause of this disaster? Another idea of why we should reduce the greenhouse gases is "The level of Carbon dioxide in the Earth's atmosphere has been rising consistently for decades and traps extra heat near earth's surface" (NASA).

Leaving this would cause many harmful effects to environments like global warming, sea level rising, and polar ice caps melting. Instead, to reduce greenhouse gas emissions, we can use renewable energy. There are many renewable energy sources like solar, wind, Biomass etc. Some benefits of renewable energy are "Generating energy that produces no greenhouse gas emissions from fossil fuels and reduces some types of air pollution" (EPA). With less fossil fuels burning, greenhouse gas emissions would stop releasing so much, which is a wonderful thing. Another positive effect of renewable energy is "Creating economic development and jobs in manufacturing, installation, and more" (EPA)(Britannica). As you see, renewable energy has many positive effects on both us and nature.

Assembly Member, Nader J. Sayegh, you also want to help the environment. I would love to see future kids playing in the snow and not having to worry about the Greenhouse Effect. If you would like to take part in this and help the world. You can stop the Greenhouse Effect from getting worse by using renewable energy instead of fossil fuels.
