

Ramel Defran

I am thankful for Science because Science helps you learn. Science teaches us how things work and that is something that interests me very much.

The first fact that I like about Science is that Science is a way to study, improve and correct previous ideas about the earth. I personally like to know why things are the way they are.

Second, Science is very interesting. I really enjoy biology. It is amazing to learn how the body works. In addition without Science you could not learn how the body function and the major function of each organism in our body.

Finally, Science is a very important part of our life. Without Science we will not be able to learn about math, chemistry, biology, earth, animals, space and everything that surround us.

The earth is a beautiful place

The earth is a fascinating place and through science there are many ways to explore the world around us. There are just ways too many things to discover through science that you would never be bored.
